LIVE BIRTHS

In 2020, there were 10,792 births in Delaware; 9,827 were to Delaware residents and 965 were to non-residents. Additionally 525 births to Delaware residents occurred out of state, for a total of 10,352 Delaware resident births, 24 more Delaware resident births than in 2019.

The recent national declines in general fertility and live birth rates were also apparent in Delaware statistics. From 2007 to 2020, the general fertility rate (number of births per 1,000 women aged 15-44 years) declined from a high of 67.4 to 55.2 births per 1,000 women aged 15-44. The birth rate of women aged 15-19 (teens) exhibited the largest decline at 64 percent followed by women aged 20-24 that decreased 41 percent and women aged 25-29 that decreased 26 percent.

During this time period women in the 40-44 aged group had the largest increase at 31 percent from 9.1 to 11.9 births per 1,000 women followed by women aged 25-39 that increased 13 percent. Since 2007 the number of births to women aged 30-34 has not significantly changed.

Figure 8. Annual Fertility and Age-Specific Live Birth Rates, Delaware, 2005-2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

From 2016 to 2020, the decline in the number of births seen in teens aged 15-19 was apparent in both the 15-17 and 18-19 age groups. Birth rates among teens aged 15-17 decreased 31 percent while birth rates among teens 18-19 fell 29 percent.

In the 2016-2020 time period, Sussex County had the highest five year-average birth rate for teens in both age groups, followed by Kent County. To view long-term birth rate trends by more detailed age and race categories, see Tables C-5 through C-8 in the Live Births section of the annual report.

LIVE BIRTHS

Between 2002 and 2020, the percentage of births to women aged 35 or older exhibited a clear upward trend. The percentage remained relatively unchanged until 2014 when it reached 14.9. Since then, it increased to 19 percent in 2020, a 40.7 percent increase from 2002. Hispanic mothers aged 35 and older had the greatest percentage increase in births from 8.1 in 2002 to 17.1 in 2020.

* Note: Hispanic can be of any race

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

For mothers of all ages, the rate of plural births decreased 17 percent between 2002-2006 and 2016-2020. In 2016-2020, older mothers (35+) had the highest plural birth rates, at 36 multiples per 1,000 births, more than twice that of mothers under 20, and 15 percent higher than mothers 20-34.

LIVE BIRTHS

In 2020, private insurance or Medicaid were listed as the primary source of payment in 94 percent of all live births; the remaining 6 percent were split between other government coverage and self-pay.

- In 2020, in all race categories, majority of women over thirty (64 percent) had private insurance as their primary source of payment.
- Medicaid was still the primary source of payment for the majority of mothers under 20, covering 69.9 percent of non-Hispanic black mothers, and 67.9 percent of non-Hispanic white mothers in that age group.

Figure 11. Percentage of Births by Source of Payment for Delivery, Delaware, 1997-2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

As in previous years, the primary source of payment for delivery in 2020 varies tremendously based on marital status:

- The number of single non-Hispanic white women who used Medicaid as their primary source of payment (57.4 percent) was around five times that of non-Hispanic white married women (9.6 percent).
- The number of single non-Hispanic black women who used Medicaid as their primary source of payment (64.2 percent) was more than two times that of non-Hispanic black married women (30.9 percent).
- The percentage of single women of other non-Hispanic races who used Medicaid as their primary source of payment (52.7 percent) was more than three times higher than among married women of other non-Hispanic races (16.0 percent).
- The number of single Hispanic women who used Medicaid as their primary source of payment (75.7 percent) was 1.4 times higher than Hispanic married women (52.3 percent).

LIVE BIRTHS

After increasing steadily from 2002 to 2008, the percentage of births to unmarried women stabilized with less than a one percent decrease from 2008 to 2020. Births to married women decreased steadily from 1994 to 2008 but stabilized ending with no significant change from 2008 to 2020. In 2020, 47.9 percent of all births were to unmarried women.

Figure 13. Annual Percentage of Births by Mother's Marital Status, Delaware, 2002-2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

In 2020, 34 percent of births were to single non-Hispanic white women, a slight increase from 32 percent in 2002. The percentage of births to single Hispanic women increased from 56 percent in 2002 to 62 percent in 2020. Unmarried non-Hispanic black women had the highest percentage of births from 2002 to 2020, remaining stable at approximately 70 percent during this time period.

LIVE BIRTHS

From 2002 to 2020, the percentage of cesarean deliveries increased 16 percent, to 31.7 per 100 live births, whereas vaginal births decreased only 6 percent from 72.7 to 68.2 per 100 live births. Since 2002, the percentage of cesarean deliveries increased for both preterm (<37 weeks gestation) and term (37+ weeks gestation) births. The percentage of C-sections for preterm births remained higher at 50.4 per 100 preterm births, versus 29.5 per 100 term births in 2020.

Figure 15. Annual Rate of Cesarean Deliveries by Gestational Category, Delaware, 2002-2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

From 2000 to 2020, the percentage of Delaware mothers who used tobacco while pregnant decreased in all three counties and the city of Wilmington. In 2020, Sussex County had the highest percentage of mothers who smoked while pregnant at 9.9 and followed by the City of Wilmington at 9.6. The Balance of New Castle County had the lowest percentage at 4.8.

Figure 16. Percentage of Mothers who Smoked while Pregnant, Delaware Counties and City of Wilmington, 2000 and 2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

LIVE BIRTHS

In 2020, the percentage of non-Hispanic white women less than 20 years old who smoked while pregnant was more than 16 times that of non-Hispanic black women . During this same time period 7.8 percent of non-Hispanic black women over 35 years old smoked while pregnant compared to 8.4 percent of non-Hispanic white women.

Figure 17. Percentage of Mothers who Smoked While Pregnant by Age Group and Race, Delaware, 2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

In 2020, 15.0 percent of Delaware women who smoked while pregnant gave birth to low birthweight babies (< 2,500 grams), versus the significantly lower percentage (8.6) of non-smokers who gave birth to low birthweight babies.

The percent distribution of births by birthweight did not differ significantly between 2000 and 2020. The greatest percentage of births fell within the 3,000 to 3,499 gram range.

Figure 18. Percent Distribution of Births by Birthweight, Delaware, 2000 and 2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistics Center

LIVE BIRTHS

In 2016-2020 the five-year percentage of low birthweight (LBW) births and very low birthweight (VLBW) births remained relatively stable at 9.1 and 1.7, respectively. The percentage of LBW births was greatest for mothers in the 40 and older age group (11.5 percent) and lowest for those in the 30-34 age group (8.4 percent).

Figure 19. Five-year Percentage of Low Birthweight Births (<2,500 grams) by Mother's Age, Delaware, 2016-2020

Source: Delaware Department of Health and Social Services, Division of Public Health, Delaware Health Statistic Center

Between 2000-2004 and 2016-2020, there was a decline in the percentages of infants born at low birthweight and very low birth weight to non-Hispanic white and non-Hispanic black mothers. During this same time period, the percentage of infants born at both low birth weight and very low birthweight to Hispanic mothers showed an increase of 7 percent and 15 percent respectively. In 2016-2020 among mothers of all ages, non-Hispanic black mothers had the highest percentage of LBW and VLBW births at 13.7 percent and 3.1 percent.

Figure 20. Five-year Average Percentage of Low (<2,500 grams) and Very Low Birth Weight Births (<1,500 grams) by Race and Hispanic Origin, Delaware, 2000-2004 and 2016-2020

Notes:

1. Teenage live birth rates represent the number of live births in a specific age category (e.g., 15-19) per 1,000 women in that age category.
2. Historical rates may change from one annual report to another due to refinements in the population estimates. Therefore, historical trends should not be examined by comparing rates from previous annual reports.

Notes:

1. Historical rates may change from one annual report to another due to refinements in the population estimates. Therefore, historical trends should not be examined by comparing rates from previous annual reports.

2. General fertility rates represent the total number of live births per 1,000 women 15-44 years of age.

3. Age-specific live birth rates represent the number of live births in a specific age category per 1,000 women in that age category.

** The number of births shown is the total for women aged 45-54 years. The birth rate is computed by dividing births to women aged 45-54 years by women aged 45-49 years, because most of the births in this group are to women aged 45-49.

Notes:

1. Historical rates may change from one annual report to another due to refinements in the population estimates. Therefore, historical trends should not be examined by comparing rates from previous annual reports.

2. General fertility rates represent the total number of live births per 1,000 women 15-44 years of age.

3. Age-specific live birth rates represent the number of live births in a specific age category per 1,000 women in that age category.

** The number of births shown is the total for women aged 45-54 years. The birth rate is computed by dividing births to women aged 45-54 years by women aged 45-49 years, because most of the births in this group are to women aged 45-49.

Notes:

1. Percentages may not add to 100% due to rounding.
 2. Percentages are calculated based upon the total number of births in each race/origin category.
 3. Percentages for the categories "Other" and "Hispanic" should be interpreted with caution due to small numbers.
- * Mothers of Hispanic origin may be of any race. See Hispanic Origin and Race in the Technical Notes.

Notes:

1. Live birth order is the number of children born alive to the mother including the current birth.
 2. Percentages may not add to 100% due to rounding.
 3. Percentages are calculated based upon the total number of births in each race/origin category.
 4. Percentages for the categories "Other" and "Hispanic" should be interpreted with caution due to small numbers.
- * Mothers of Hispanic origin may be of any race. See Hispanic Origin and Race in the Technical Notes.
