

INFANT MORTALITY

Delaware's infant mortality rate (IMR) decreased for the second consecutive time period. From 2002-2006 to 2003-2007, it declined 3 percent, from 8.8 infant deaths per 1000 live births in 2002-2006 to 8.5 in 2003-2007. The U.S. rate held steady at 6.8, and remained significantly lower than the Delaware rate.

**Five-year Average Infant Mortality Rates
Delaware and U.S., 1980-2007**

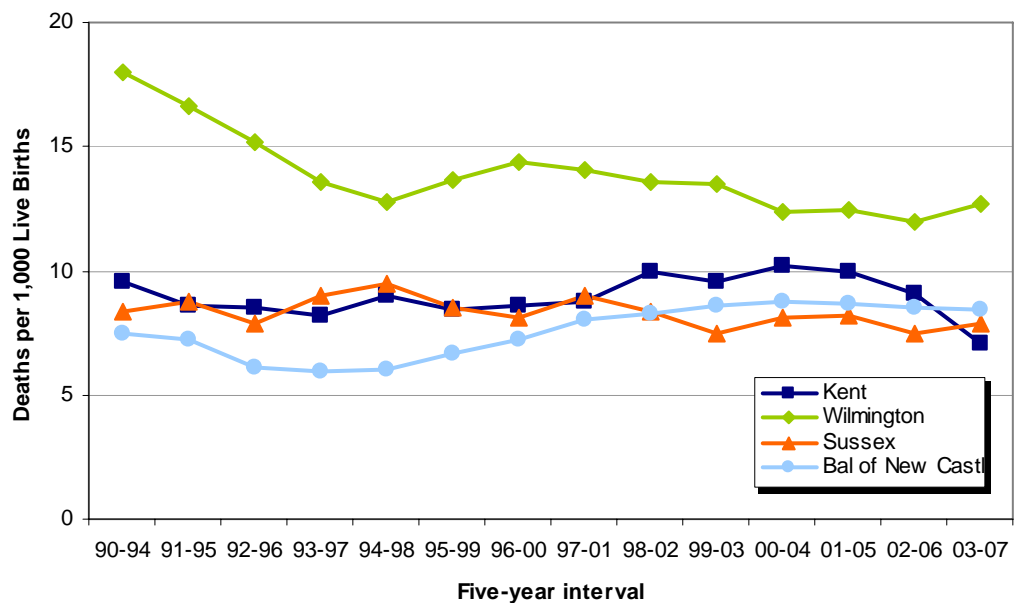

Source: Delaware health Statistics Center

IMRs for Sussex County and the city of Wilmington increased from 2002-2006 to 2003-2007. Kent County's IMR declined for the third consecutive time period, making it the lowest of the three counties at 7.1 infant deaths per 1,000 live births.

IMRs for the balance of New Castle County and the County as a whole changed very little from 2002-2006 to 2003-2007.

**Five-year Average Infant Mortality Rates
Delaware Counties and City of Wilmington, Delaware, 1990-2007**

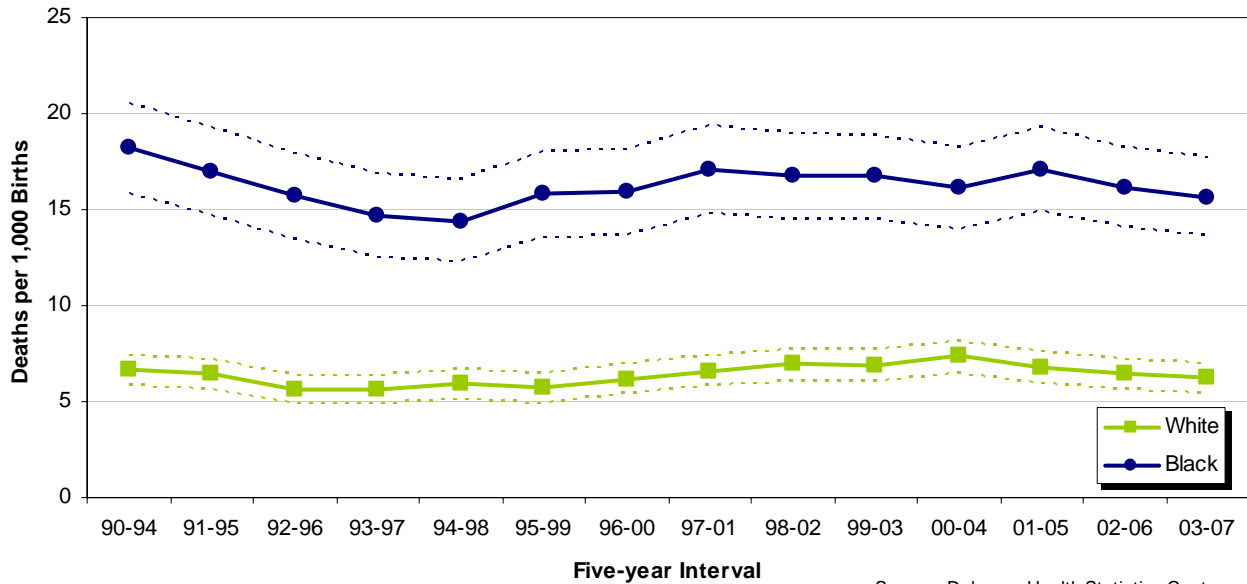

Source: Delaware health Statistics Center

INFANT MORTALITY

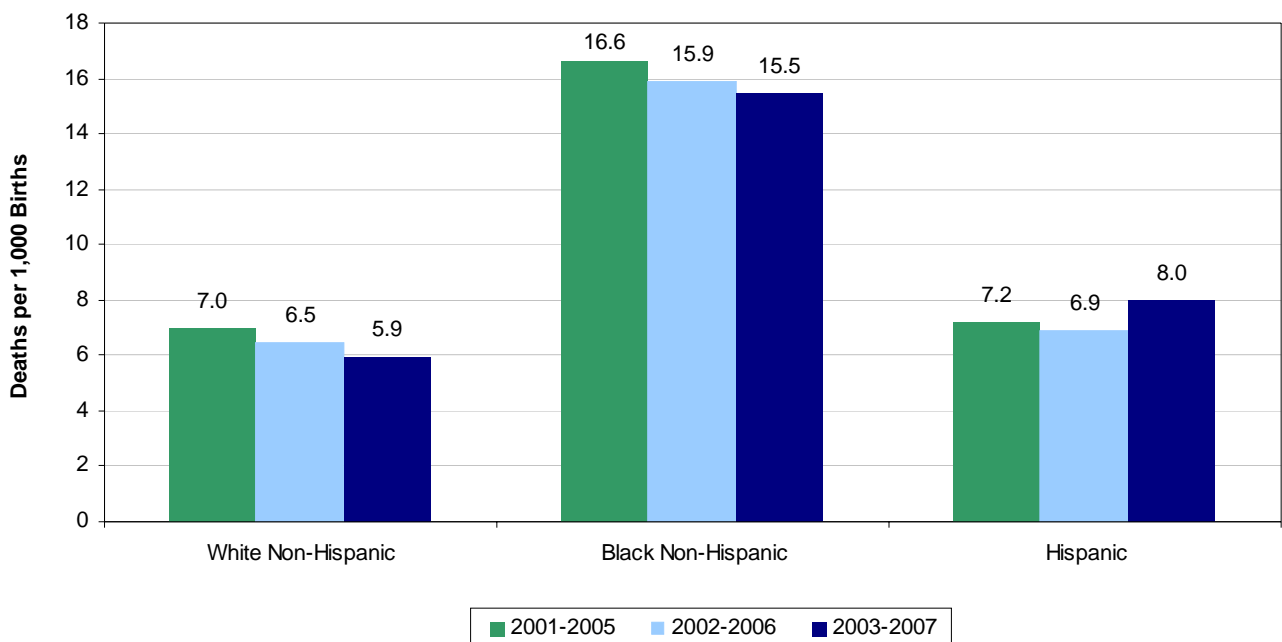

From 2002-2006 to 2003-2007, the five-year IMR decreased very slightly due to decreases in both the white IMR (from 6.4 to 6.2) and the black IMR (from 16.1 to 15.6). As shown in the graph below, black infants experienced significantly higher mortality rates than white infants, and from 1990-1994 to 2003-2007, black IMRs were anywhere from 2.2 to 2.8 times that of white IMRs.

**Five-year Average Black and White Infant Mortality Rates with Confidence Intervals
Delaware, 1990-2007**

Significant disparities existed between black non-Hispanic IMRs and each of the two other groups, white non-Hispanic and Hispanic. Black non-Hispanics had the highest IMRs in all three time periods, and their rate of 15.5 deaths per 1,000 live births in 2003-2007, was 2.6 times the white non-Hispanic rate of 5.9 and nearly twice the Hispanic rate of 8.0.

**Five-year Average Infant Mortality Rates by Race and Hispanic Origin
Delaware, 2001-2007**

INFANT MORTALITY

Not only did IMRs vary between counties, but also between races within each county. Black IMRs were consistently higher than white IMRs in all three counties, for every time period. To gauge the disparity between black and white IMRs, disparity ratios¹ were used. However, as is shown in the graphs to the right, both the disparity ratio and the rates should be considered when examining the issue of infant mortality.

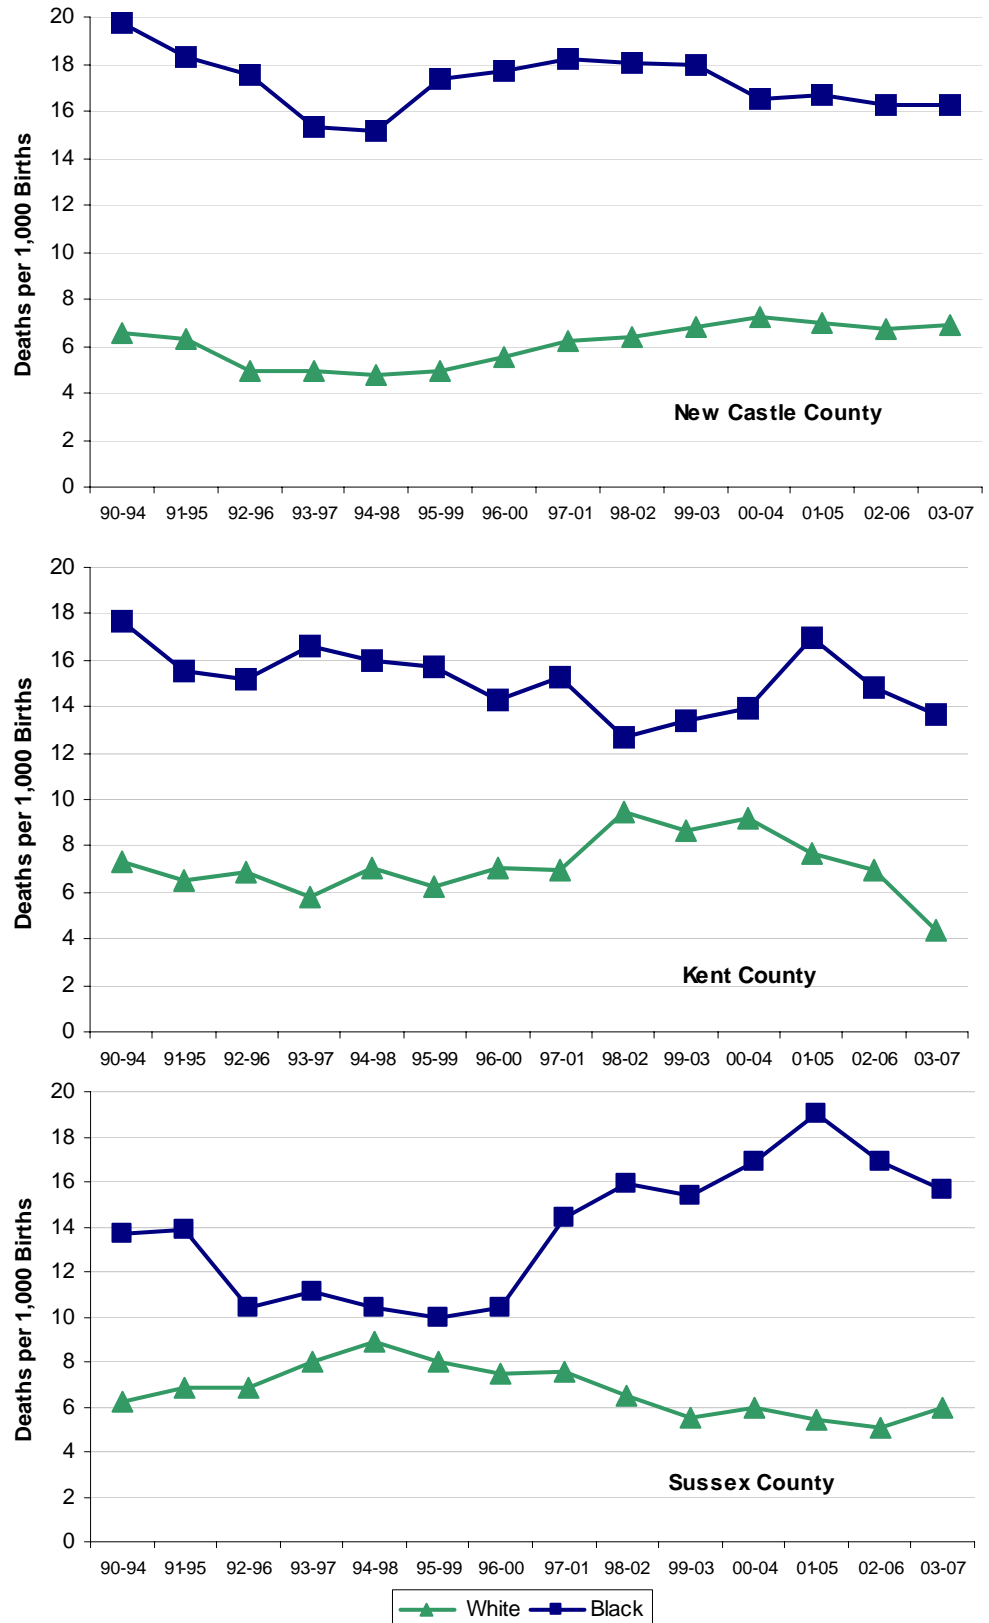

In New Castle County, rates for both races changed very little from 2002-2006 to 2003-2007, and the disparity ratio remained stable at 2.3.

Though both black and white IMRs declined in Kent County, from 14.8 to 13.6 and from 7.0 to 4.4, the change was greater for whites, causing its disparity ratio to increase to 3.1, the largest of the three counties.

Sussex County's disparity ratio narrowed due to a continued decrease in the black IMR and an increase in the white IMR.

Of the three counties, New Castle had the highest IMR (16.2 infant deaths per 1,000 live births to black mothers), while Kent had the lowest (4.4 infant deaths per 1,000 live births to white mothers).

Five-year Average Infant Mortality Rates by Race
Delaware Counties, 1990-2007

Source: Delaware Health Statistics Center

1. Disparity ratios were calculated by dividing the black IMR by the white IMR; the resulting number demonstrated the magnitude of difference between black and white.

INFANT MORTALITY- Leading Cause of Death

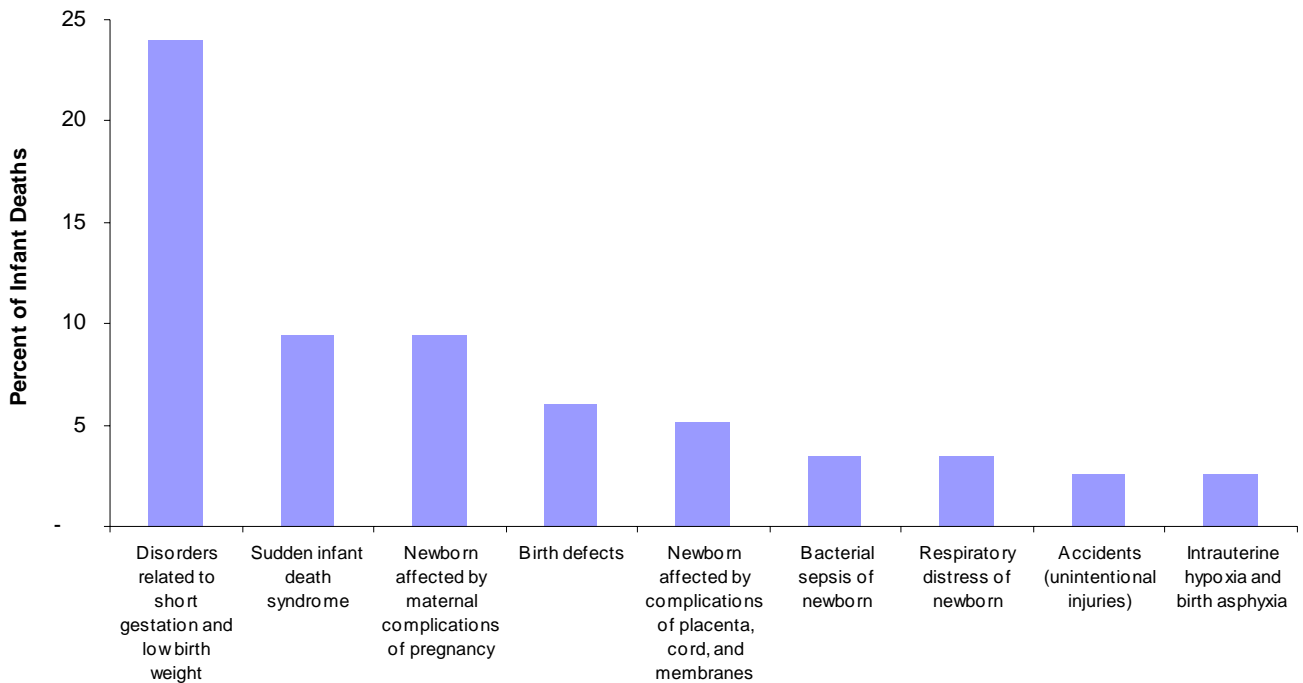

In 2003-2007 the three leading causes of infant death were:

- Disorders related to short gestation and fetal malnutrition (prematurity and low birthweight), which accounted for 22.3 percent of infant deaths,
- Congenital anomalies (birth defects), which accounted for 12.5 percent of infant deaths, and
- Newborn affected by maternal complications of pregnancy, which accounted for 8.7 percent of infant deaths. Of the 43 deaths attributed to this cause, 39 were due to the newborn being affected by incompetent cervix and premature rupture of membranes.

Shown in the graphs below and on the following page are the most frequent causes of death by race. Disorders related to short gestation and low birthweight and newborn affected by maternal complications of pregnancy were listed in the top three most frequent causes of death for both black and white infants.

Though the proportions of deaths by race were similar for many of the causes of death, a notable exception was birth defects. While birth defects were responsible for 17.1 percent of all white infant deaths, they accounted for only 6 percent of black infant deaths.

Source: Delaware Health Statistics Center

INFANT MORTALITY- Leading Cause of Death

**Most Frequent Causes of White Infant Death
Delaware, 2003-2007**

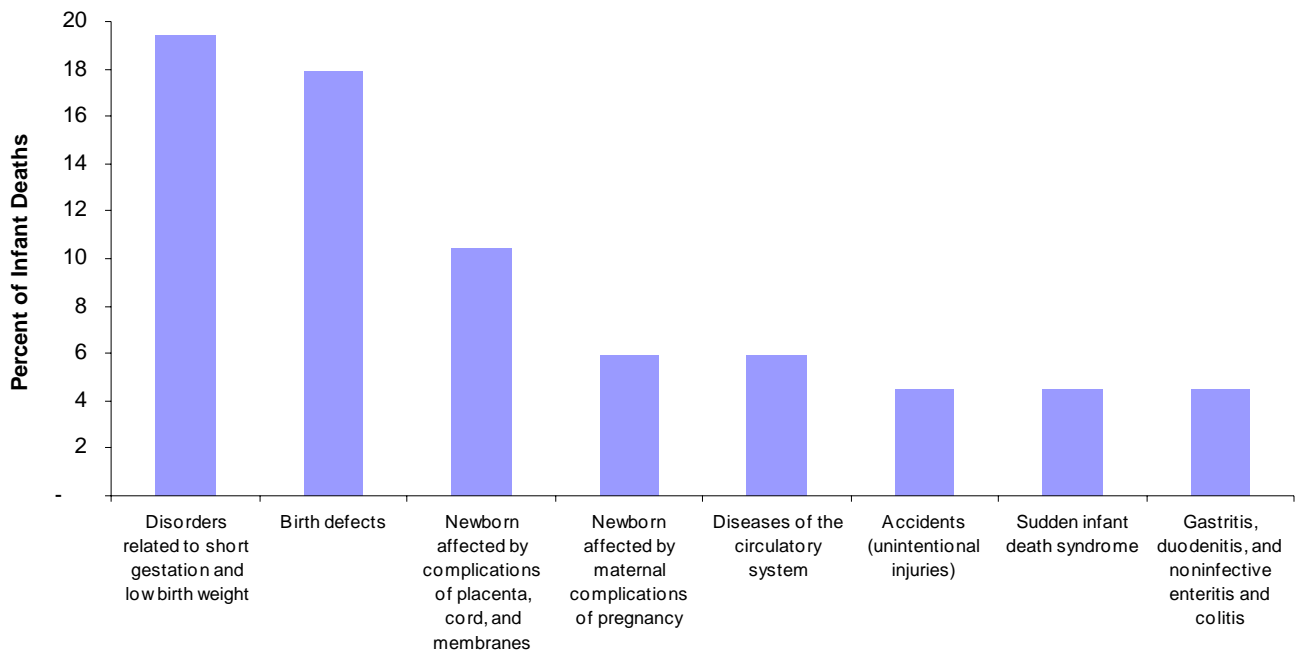

Source: Delaware Health Statistics Center

In the 1989-1993 time period, Hispanics accounted for 3.6 percent of all live births and 3.4 percent of infant deaths, since that time the proportion of births to Hispanic mothers has been increasing. In the most recent five year period, 2003-2007, 14.4 percent of all live births were to Hispanic mothers, and 13.5 percent of all infant deaths were of Hispanic origin.

The leading cause of death for infants of Hispanic origin was disorders related to short gestation and low birthweight, followed by birth defects.

**Most Frequent Causes of Hispanic Infant Death
Delaware, 2003-2007**

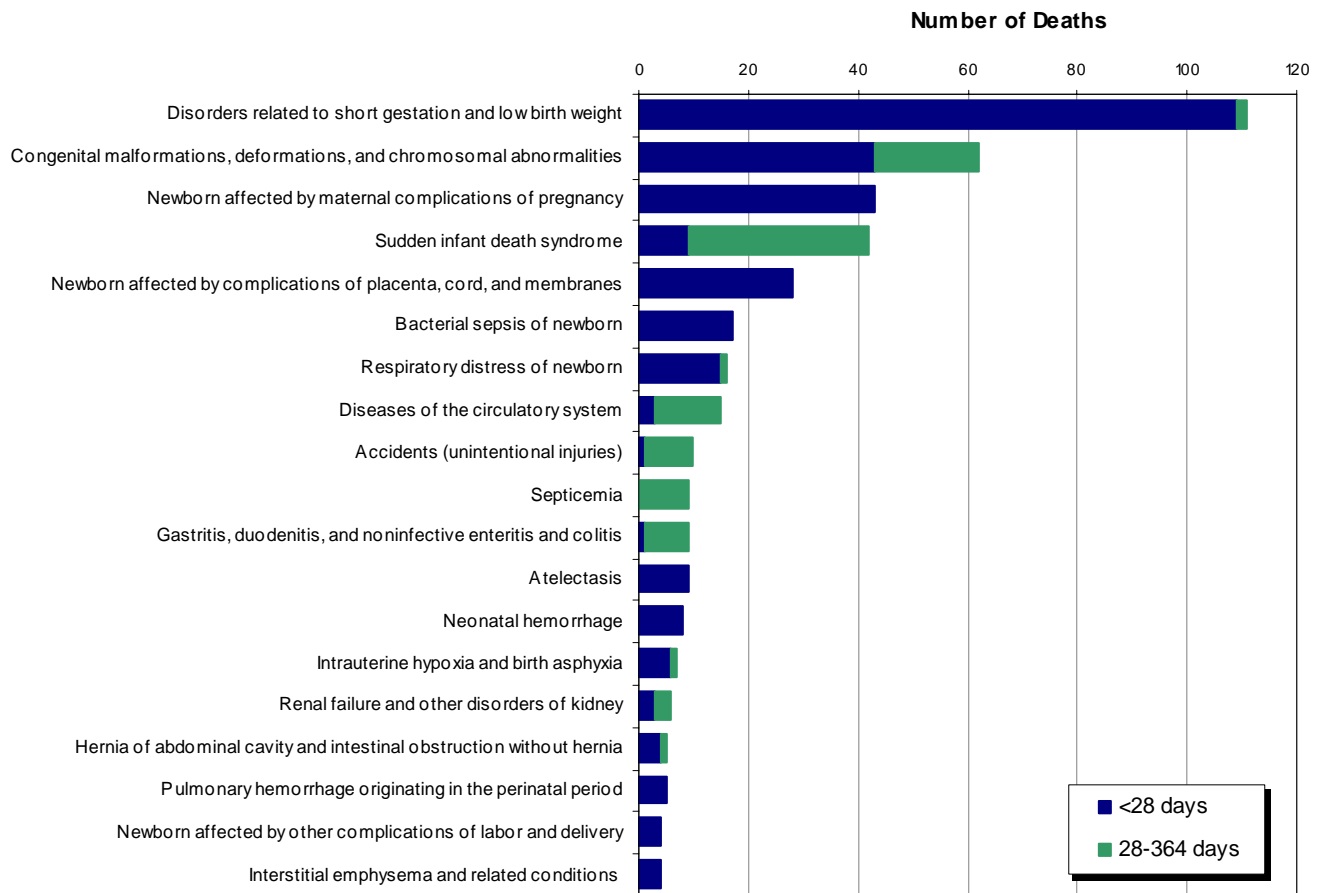

Source: Delaware Health Statistics Center

INFANT MORTALITY - Leading Cause of Death

Approximately 95 percent of all infant deaths occurred within the first six months of life, 71 percent of all infant deaths occurred within the first 28 days of life, and 39 percent occurred within 24 hours of birth.

The graph below displays deaths by specific cause and the infant's age classification at death, neonatal (<28 days) or postneonatal (28-364 days).

Most Frequent Causes of Infant Death Delaware, 2003-2007

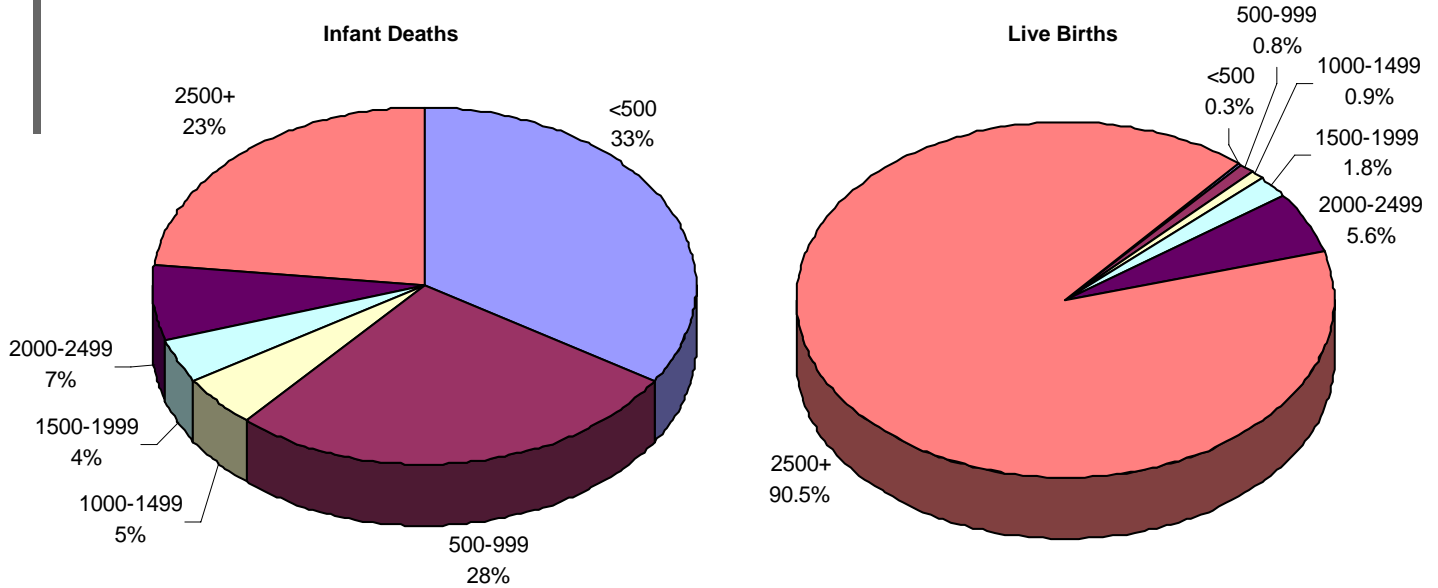

- Disorders related to short gestation and fetal malnutrition accounted for the greatest number of infant deaths in 2003-2007; all but two of these deaths occurred in the neonatal period.
- Sudden infant death syndrome (SIDS) was the only one of the top five causes of death that had the majority of deaths occurring in the postneonatal period, with a mean age at death of 75 days.
 - ⇒ 40 percent (17 out of 42) of the SIDS deaths were associated with co-sleeping with adults and/or sleeping on soft surfaces, such as couches and adult beds.
- During that same time period, there were 22 additional infant deaths, coded under a different cause of death, that were associated with co-sleeping and/or sleeping on a soft surface. In total, 7.8 percent of all infant deaths in 2003-2007 were associated with co-sleeping and/or sleeping on a soft surface.

INFANT MORTALITY - Live Birth Cohort

Just over 1 percent of all live births were infants weighing less than 1000 grams, but they accounted for over half (61.2 percent) of all infant deaths in 2002-2006. In total, 9.4 percent of all live births in 2002-2006 were infants of low birthweight (under 2500 grams) and 76.5 percent of infant deaths were low birthweight.

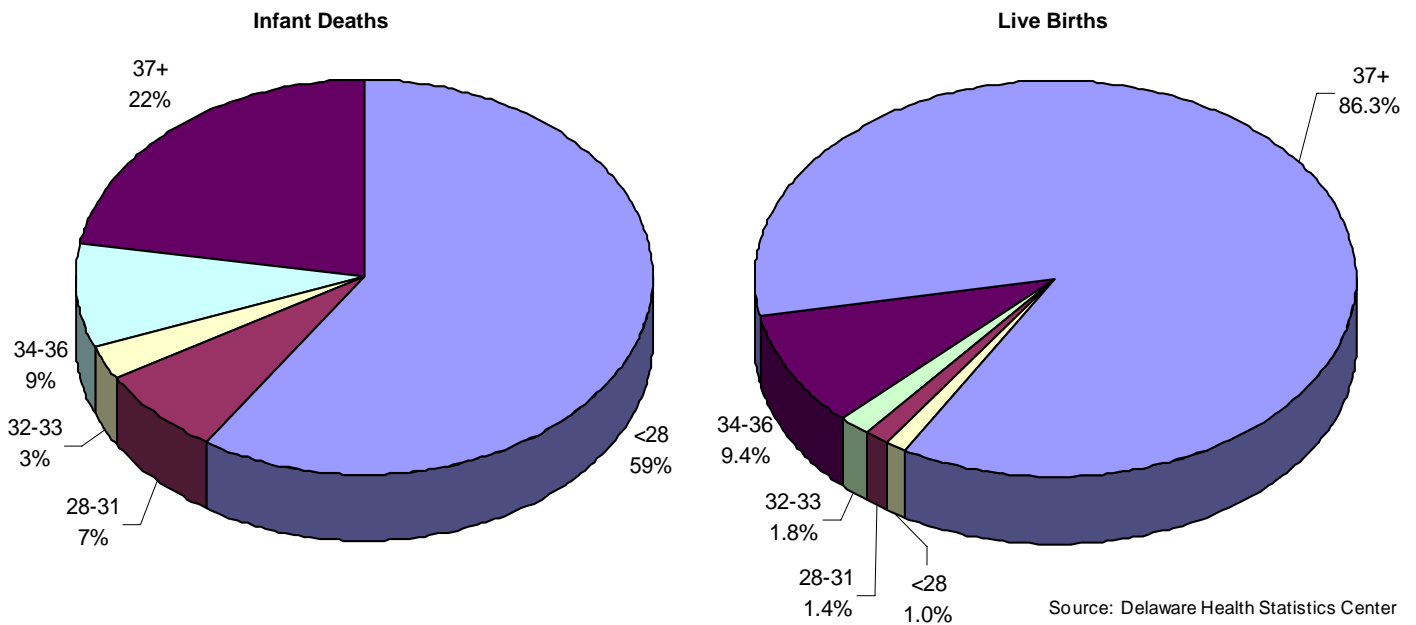

Distribution by Birthweight, Delaware Live Birth Cohort, 2002-2006

Source: Delaware Health Statistics Center

One percent of live births in 2002-2006 were less than 28 weeks gestation at birth, but they accounted for 59 percent of all infant deaths. In total, 13.7 percent of all live births in 2002-2006 were born preterm (<37 weeks of gestation) and 77.7 percent of infant deaths were born preterm.

Distribution by Gestation, Delaware Live Birth Cohort, 2002-2006

Source: Delaware Health Statistics Center

INFANT MORTALITY - Live Birth Cohort

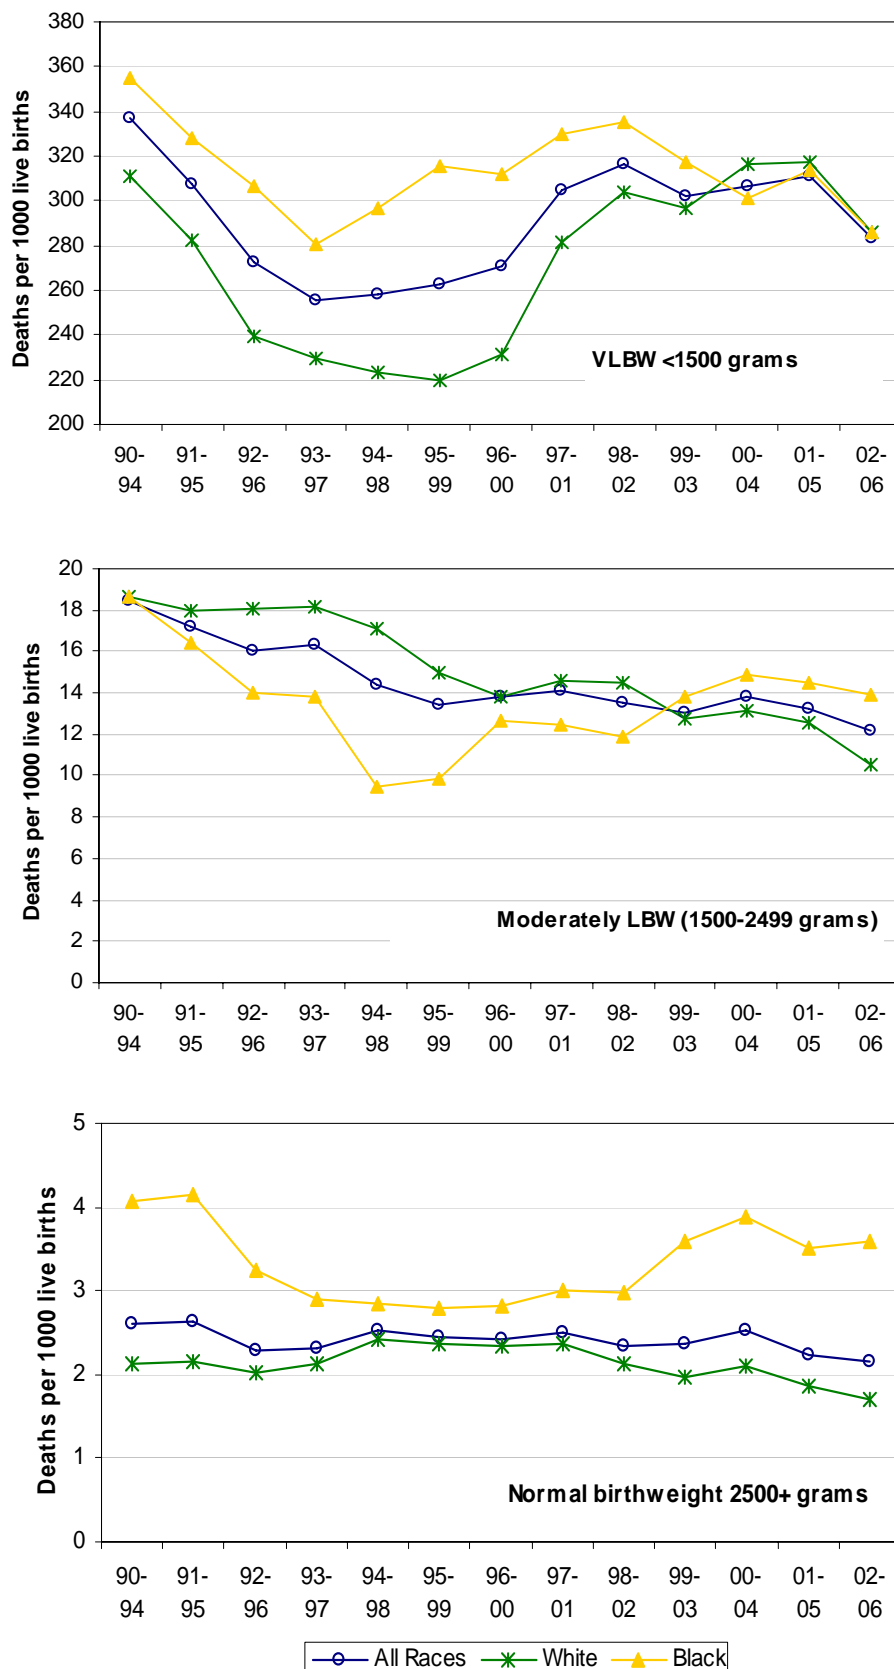

Birthweight and gestation are considered to be the most important predictors of infant health and mortality risk. Infants born too small or too early have a much greater risk of mortality than those who reach a normal birthweight (2500+ grams) or full-term gestation (37+ weeks).

As a result of the 11 percent decrease from 2001-2005 to 2002-2006, IMRs for VLBW white infants experienced little overall change since 1997-2001. IMRs for black VLBW infants declined 13 percent between 1997-2001 and 2002-2006; in 2002-2006 both black and white VLBW infants had an IMR of 286 deaths per 1,000 live births.

IMRs of moderately LBW infants moved in a different manner, with white rates declining 28 percent between 1997-2001 and 2002-2006, and black rates rising 11 percent during the same time, which made their rates 32 percent higher than white rates in 2002-2006 (13.9 vs. 10.5).

From 1997-2001 forward, the IMR trends for normal birthweight infants followed that of the moderately LBW infants, with white IMRs decreasing by 28 percent and black IMRs increasing by 19 percent. The divergent movement in black and white rates widened the black/white disparity ratio, and in 2002-2006, the black IMR for normal birthweight infants was more than double that of whites (3.6 vs. 1.7).

Five-year Average Infant Mortality Rate by Birthweight and Race Delaware, 1990-2006 Live Birth Cohort

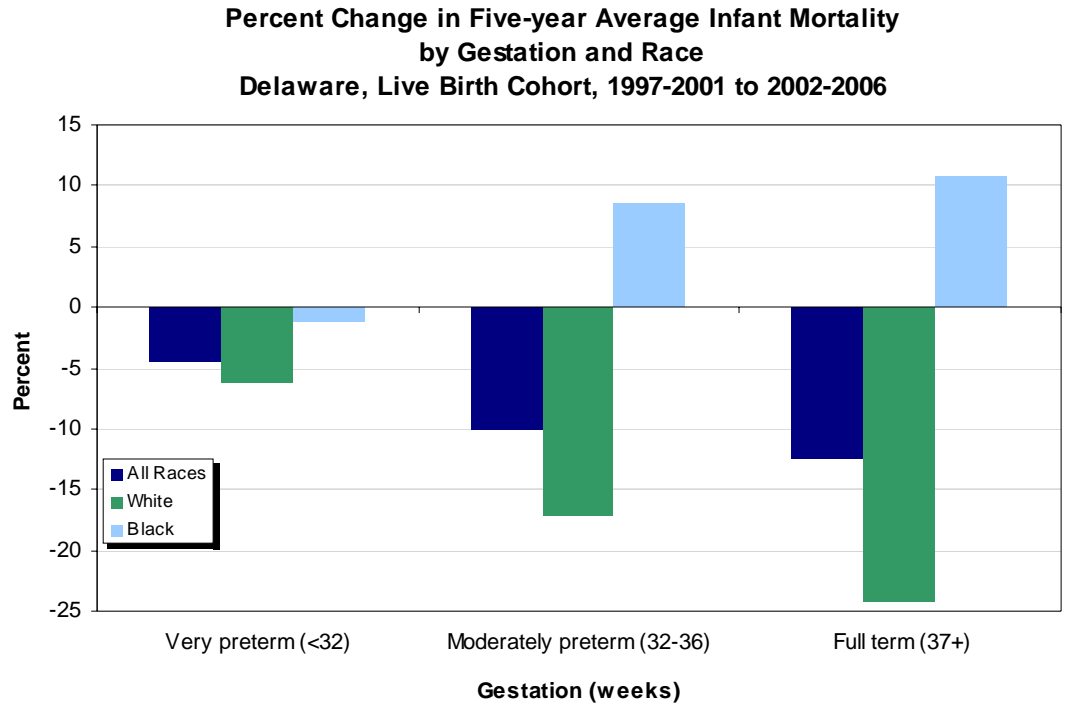

1. VLBW—very low birthweight, is defined as less than 1500 grams .

Source: Delaware Health Statistics Center

INFANT MORTALITY - Live Birth Cohort

The change in IMRs by gestation and race for moderately premature (32-36 weeks) and full-term (37+ weeks) infants followed a pattern similar to that of moderately low and normal birthweight infants.

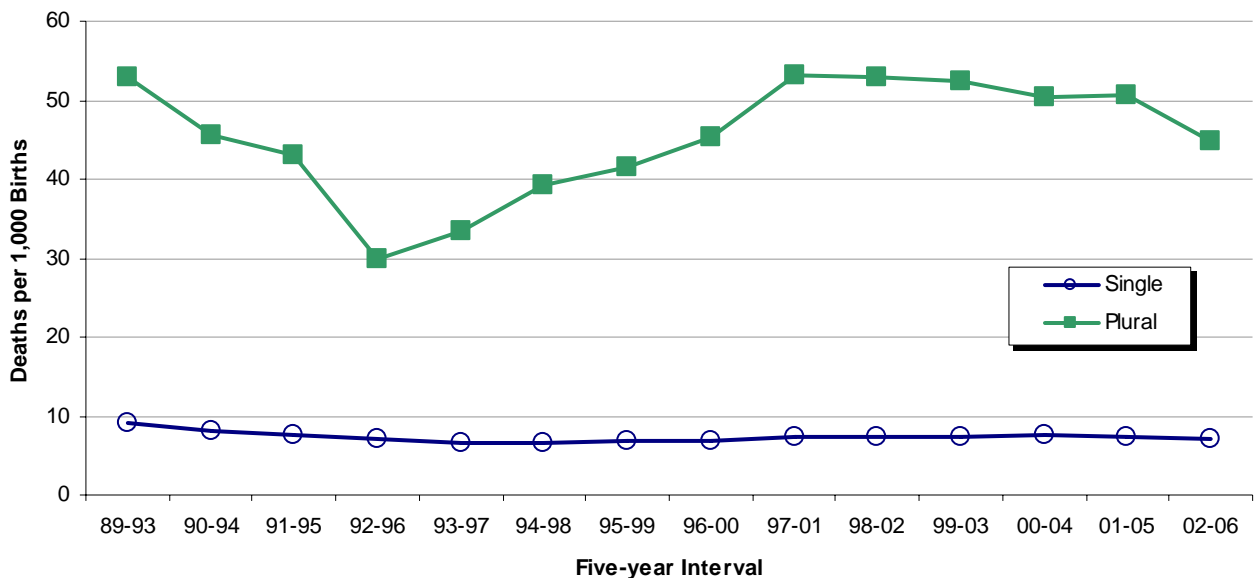

IMRs for very preterm infants of both races experienced a slight overall decline during the same time period.

Source: Delaware Health Statistics Center

From 1992-1996 to 1997-2001, IMRs for plural births increased 77 percent, to 53.1 deaths per 1000 live births; during the same time, IMRs for singleton births increased by 4 percent. Since then, plural IMRs have decreased a total of 16 percent, with most of that occurring in the most recent time period. The decrease in IMRs for singleton births was slight and occurred only in the most recent time period. In 2002-2006, infant mortality rates for plural births were over 6 times that of singleton births (44.7 vs. 7.0).

Notes:

1. 2003-2007 US data are based on NCHS estimates.
2. N/A indicates data not available.
3. Infant mortality rates represent the number of deaths of children under one year of age per 1000 live births.
4. '+' indicates that the Delaware rate is significantly higher than the U.S. rate.
'-' indicates that the Delaware rate is significantly lower than the U.S. rate.
5. "----" Indicates rate does not meet standard of reliability or precision; based on fewer than 20 deaths in the numerator.
6. No statistical comparisons were made between the county rates and the U.S. rate due to small numbers. See Appendix C for details.

PERL_RACE

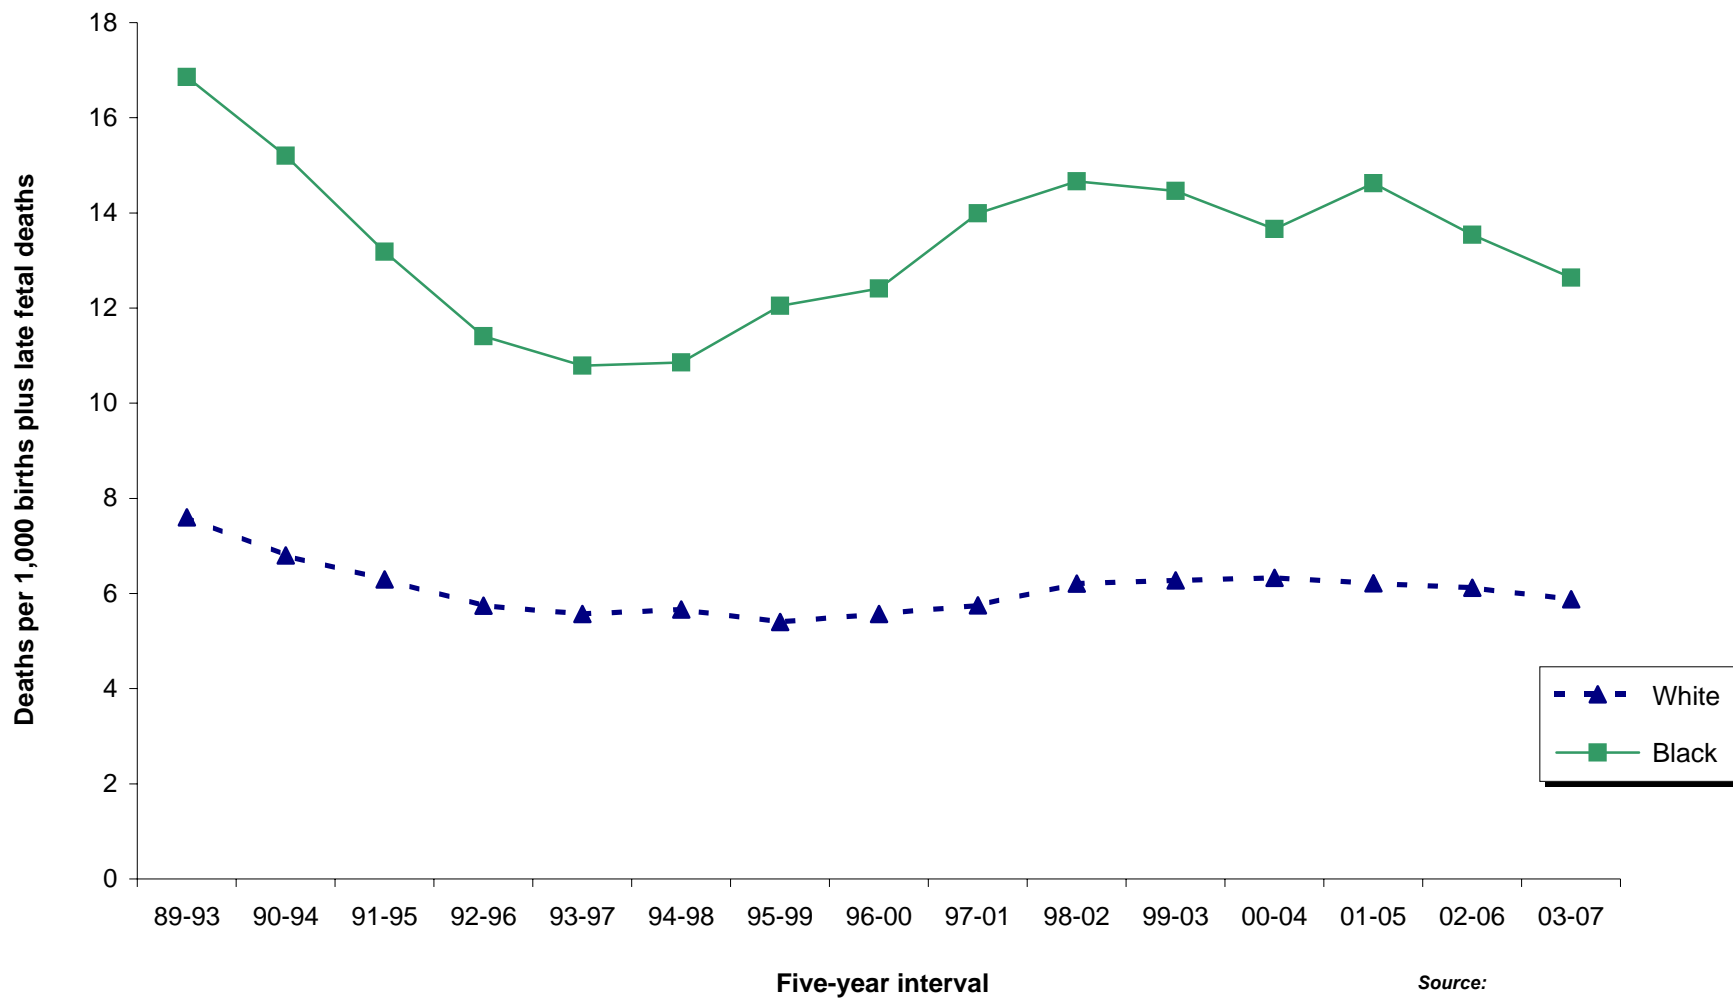

Notes:

1. Perinatal relates to the period surrounding the birth event.
2. The perinatal mortality rate is the sum of late fetal deaths (28+ weeks gestation) and early infant deaths (<7 days of age) per 1,000 live births and late fetal deaths.

Age of Mother			
<20	11.0	11.0	11.6
20-24	8.9	6.4	14.0
25-29	8.8	5.6	19.2
30+	7.2	5.9	14.3
Marital Status of Mother			
Married	6.2	5.1	13.1
Single	11.5	8.7	15.6
Education of Mother			
<12 years	9.5	8.2	13.3
H.S. diploma	11.3	7.9	18.5
1+ years college	5.7	4.4	11.1
Trimester Care Received			
Late/No PNC ²	21.3	16.2	33.0
First	7.8	5.9	13.8
Interval Since Last Live Birth			
<18 months	13.4	9.7	20.5
18+ months	6.6	4.2	13.6

COHRATES

Notes:

1. Infant mortality rates represent the number of deaths to children under one year of age per 1,000 live births.
2. Defined as receiving no care or care in the third trimester.

INFLCOD

Notes:

1. Leading causes of infant death are categorized using the NCHS rankable causes of infant death, specific ICD-10 codes are shown in Appendix D.
2. Very preterm is defined as less than 32 weeks of gestation.
3. Moderately preterm is defined as between 32 and 36 weeks of gestation.
4. Term is defined as 37 and greater weeks of gestation.
5. The percent born preterm includes both the very preterm and moderately preterm groups.

COTREND

Notes:

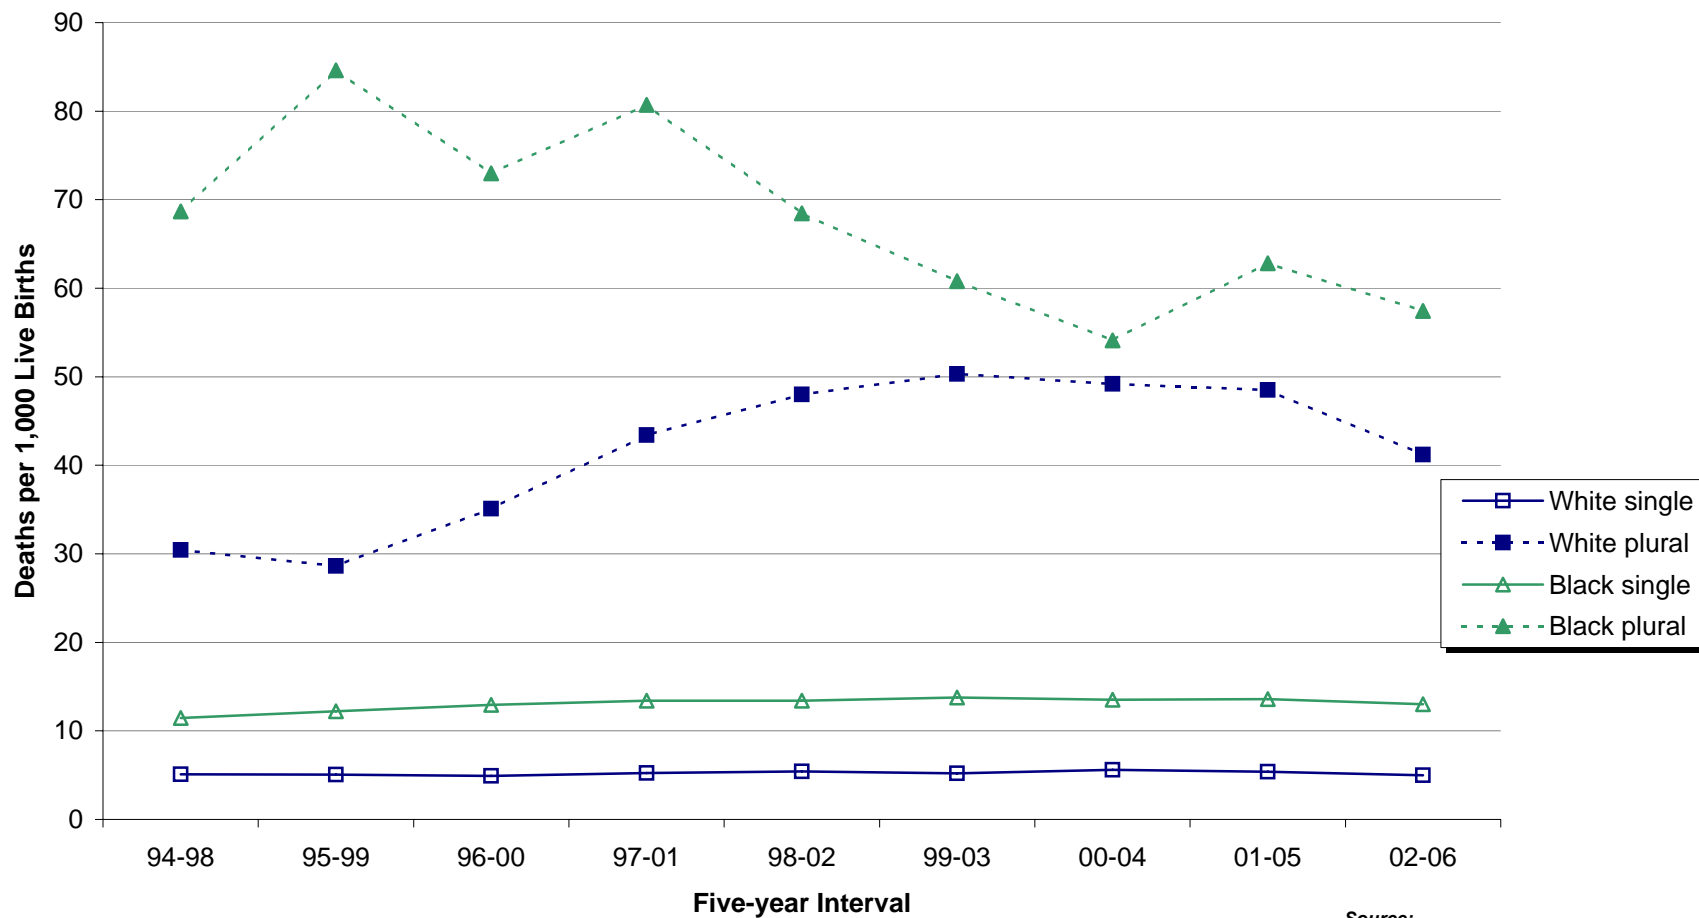

1. See the Basic Definitions section for definitions of birthweight, gestation, prenatal care attainment, and plurality.
2. "----" indicates rate does not meet standards of reliability or precision; based on fewer than 20 deaths in the numerator.
3. Primary source of payment for delivery not available prior to 1991.
