If you have been vaccinated against MPX, take a temporary break from sex or direct contact until two weeks after your second MPX vaccine dose. Limit your number of sex partners to reduce your likelihood of exposure before and after vaccination. Avoid spaces like back rooms, saunas, sex clubs, or private and public sex parties, where intimate, often anonymous, sexual contact with multiple partners may occur. Condoms (latex or polyurethane) may protect your anus, mouth, penis, or vagina from exposure to MPX. However, condoms alone may not prevent all exposures to MPX because the rash can occur on other parts of the body. Consider having virtual sex with no in-person contact. Avoid kissing. MPX can spread through respiratory secretions with prolonged close face-to-face contact. CDC recommends masturbating together at a distance without touching each other and without touching any rash. Consider having sex with your clothes on or covering areas where rash is present, reducing as much skin-to-skin contact as possible. Leather or latex gear also provides a barrier to skin-to-skin contact. Be sure to change or clean clothes/gear between partners and after use. Remember to wash your hands, fetish gear, sex toys, and any fabrics (bedding, towels, clothes) after having sex.
